Iteration 5 Report

What Went Right:
- **Successfully implemented the feature to export tables (like transactions) to CVS.**
- **General redesign on website (keeping the same features) to give it a more modern feel as well as being responsive**
- **Communication among team has progressively been getting better, and the way tasks were divided up and how we worked as a team this iteration has been the best we have done so far.**
- **All data for the user is being grabbed from the backend appropriate (shoutout to Jake for doing this)**

What Went Wrong:
- **There are still a few features we need to sort out that are a bit buggy. For example, we haven't quite figured out why only notifications of type "Deposit" cannot be deleted from the table.**
- **Currently we have a "mock user" system set up- we need to hurry to implement so that when a person registers/logs in, they see their own personal data rather than the data for the mock user we have.**
- **Notification rules are not being triggered as we would like**
- **A few minor features like the ones above we will need to scramble to hurry and finish before the deadline**

Solutions:
- **In spite of finals coming up, we really need to rally these last few days to complete the few remaining issues we have in order to meet all qualifications**
- **We will hold several longer team sessions for the next two days to tackle these issues and foreseeably resolve them. We are confident they are relatively easy fixes with only minor logical issues needing to be adjusted.**
- **Continue one with our improved communication and teamwork and finish out this semester strong!**
